

Green Your Laundry Routine!

Let's go green:

Meaningful ways to reduce the negative environmental impact of doing laundry.

-  **Only wash full loads of laundry.**
-  **Use the cold water cycle** (whenever possible) since up to 90% of the energy used for washing clothes goes to heating the water.
-  **Use 2 tablespoons of HE detergent or one laundry pod** to eliminate residue, maintain the quality of your clothes, and reduce service calls.
-  **Recycle your detergent bottles.**
-  **Clean the dryer lint screen** before and after use.
-  **Remove clothes from the dryer immediately** to reduce the need for ironing. This saves time and energy!

The cold facts:

-  An average washer uses 90% less energy when using cold water.
-  Cold water makes clothes last longer.
-  Cold water cleans as effectively as hot water.
-  Modern soap is designed to work with cold water.
-  Using cold water saves natural gas (and carbon!)
-  Oil and berry stains are the only stains that need hot water. Pre-treating works best!
